# Dora

Bento

<3

Jesse "Pinkman"

```
public Pug( String name,  
           String color,  
           Integer weight ) {  
    this.name = nome;  
    this.color = color;  
    this.weight = weight;  
}
```

```
Pug dora = new Pug( "Dora", "abricot", 10 );  
Pug bento = new Pug( "Bento", "abricot", 13 );  
Pug jesse = new Pug( "Jesse", "black", 9 );
```

# Predicate

## Interface Predicate<T>

### Type Parameters:

T - the type of the input to the predicate

### Functional Interface:

This is a functional interface and can therefore be used as the assignment target for a lambda expression or method reference.

```
@FunctionalInterface  
public interface Predicate<T>
```

Represents a predicate (boolean-valued function) of one argument.

This is a [functional interface](#) whose functional method is `test(Object)`.

### Since:

1.8

### Method Summary

All Methods	Static Methods	Instance Methods	Abstract Methods	Default Methods
Modifier and Type	Method and Description			
default <code>Predicate&lt;T&gt;</code>	<code>and(Predicate&lt;? super T&gt; other)</code> Returns a composed predicate that represents a short-circuiting logical AND of this predicate and another.			
static <T> <code>Predicate&lt;T&gt;</code>	<code>isEqual(Object targetRef)</code> Returns a predicate that tests if two arguments are equal according to <code>Objects.equals(Object, Object)</code> .			
default <code>Predicate&lt;T&gt;</code>	<code>negate()</code> Returns a predicate that represents the logical negation of this predicate.			
default <code>Predicate&lt;T&gt;</code>	<code>or(Predicate&lt;? super T&gt; other)</code> Returns a composed predicate that represents a short-circuiting logical OR of this predicate and another.			
boolean	<code>test(T t)</code> Evaluates this predicate on the given argument.			

```
Pug dora = new Pug( "Dora", "abricot", 10 );
Pug bento = new Pug( "Bento", "abricot", 13 );
Pug jesse = new Pug( "Jesse", "black", 9 );
```

```
List<Pug> pugs = Arrays.asList( dora, bento, jesse );
```

```
Predicate<Pug> abricot = pug ->
    pug.getColor().equalsIgnoreCase( "abricot" );
```

```
List<Pug> abricots = pugs.stream()
    .filter( abricot )
    .collect( toList() );
```

```
print( abricots );
```

```
Pug{nome='Dora', color='abricot', size=10}
Pug{nome='Bento', color='abricot', size=13}
```

```
Pug dora = new Pug( "Dora", "abricot", 10 );
Pug bento = new Pug( "Bento", "abricot", 13 );
Pug jesse = new Pug( "Jesse", "black", 9 );
```

```
List<Pug> pugs = Arrays.asList( dora, bento, jesse );
```

```
Predicate<Pug> abricot = pug ->
    pug.getColor().equalsIgnoreCase( "abricot" );
```

```
List<Pug> abricots = pugs.stream()
    .filter( abricot )
    .collect( toList() );
```

```
print( abricots );
```

```
Predicate<Pug> fat = pug -> pug.getWeight() > 12;
```

```
List<Pug> fatAbrikots = pugs.stream()
    .filter( fat.and( abricot ) )
    .collect( toList() );
```

```
print( fatAbrikots );
```

```
Pug{nome='Bento', color='abricot', weight=13}
```

# Consumer

```
public class ShoppingCartTest {  
  
    ShoppingCart cart;  
  
    @Before  
    public void setup() {  
        Item item1 = new Item( 10 );  
        Item item2 = new Item( 20 );  
        cart = new ShoppingCart( Arrays.asList( item1, item2 ) );  
    }  
  
    @Test  
    public void totalTest() {  
        cart.pay( ShoppingCart.PaymentMethod.CREDIT );  
    }  
}
```

```
public class ShoppingCart {  
  
    private List<Item> items;  
  
    public ShoppingCart( List<Item> items ) {  
        this.items = items;  
    }  
  
    public void pay( PaymentMethod method ) {  
        int total = cartTotal();  
        if ( method == PaymentMethod.CREDIT ) {  
            System.out.println( "Pay with credit " + total );  
        } else if ( method == PaymentMethod.MONEY ) {  
            System.out.println( "Pay with money " + total );  
        }  
    }  
  
    private int cartTotal() {  
        return items  
            .stream()  
            .mapToInt( Item::getValue )  
            .sum();  
    }  
}
```

```
public interface Payment {  
    public void pay(int amount);  
}
```

```
public class CreditCard implements Payment {  
    @Override  
    public void pay( int amount ) {  
        System.out.println( "Pay with Credit: "+ amount );  
    }  
}
```

```
public class Money implements Payment {  
    @Override  
    public void pay( int amount ) {  
        System.out.println( "Pay with Money: "+ amount );  
    }  
}
```

```
public class ShoppingCart {  
    ...  
    public void pay( Payment method ) {  
        int total = cartTotal();  
        method.pay( total );  
    }  
  
    private int cartTotal() {  
        return items  
            .stream()  
            .mapToInt( Item::getValue )  
            .sum();  
    }  
}
```

# Strategy

“Definir uma família de algoritmos, encapsular cada uma delas e torná-las intercambiáveis. Strategy permite que o algoritmo varie independentemente dos clientes que o utilizam” GAMMA, Erich et al.

```
public interface Payment {  
  
    public void pay(int amount);  
  
}  
  
public class CreditCard implements Payment {  
    @Override  
    public void pay( int amount ) {  
        System.out.println( "make credit  
payment logic" );  
    }  
}  
  
public class Money implements Payment {  
    @Override  
    public void pay( int amount ) {  
        System.out.println( "make money  
payment logic" );  
    }  
}  
  
public class DebitCard implements Payment {  
    @Override  
    public void pay( int amount ) {  
        System.out.println( "make debit  
payment logic" );  
    }  
}
```

```
public void totalTest() {  
    assertEquals( 30, cart.pay( new CreditCard() ) );  
    assertEquals( 30, cart.pay( new Money() ) );  
    assertEquals( 30, cart.pay( new DebitCard() ) );  
}  
}
```

java.util.function

## Interface Consumer<T>

### Type Parameters:

T - the type of the input to the operation

### All Known Subinterfaces:

[Stream.Builder<T>](#)

### Functional Interface:

This is a functional interface and can therefore be used as the assignment target for a lambda expression or method reference.

---

All Methods	Instance Methods	Abstract Methods	Default Methods
Modifier and Type	Method and Description		
void	<a href="#">accept(T t)</a>		Performs this operation on the given argument.
default	<a href="#">Consumer&lt;T&gt; andThen(Consumer&lt;? super T&gt; after)</a>		Returns a composed Consumer that performs, in sequence, this operation followed by the after operation.

```
public void pay( Payment method ) {  
    int total = cartTotal();  
    method.pay( total );  
}
```

```
public class ShoppingCart {  
    ...  
  
    public void pay( Consumer<Integer> method ) {  
        int total = cartTotal();  
        method.accept( total );  
    }  
    ...  
}
```

```
public class ShoppingCart {  
    ...  
  
    public void pay( Consumer<Integer> method ) {  
        int total = cartTotal();  
        method.accept( total );  
    }  
}
```

```
    ...
}

public void totalTest() {
    cart.pay( amount ->
        System.out.println( "Pay with Credit: " + amount ) );
    cart.pay( amount ->
        System.out.println( "Pay with Money: " + amount ) );
    cart.pay( amount ->
        System.out.println( "Pay with Debit: " + amount ) );
}
```

```
public class PaymentTypes {  
  
    public static void money( int amount ) {  
        System.out.println( "Pay with Money: " + amount );  
    }  
  
    public static void debit( int amount ) {  
        System.out.println( "Pay with Debit: " + amount );  
    }  
  
    public static void credit( int amount ) {  
        System.out.println( "Pay with Credit: " + amount );  
    }  
  
}  
  
public void totalTest() {  
    cart.pay( PaymentTypes::credit );  
    cart.pay( PaymentTypes::debit );  
    cart.pay( PaymentTypes::money );  
}
```

```
public class ShoppingCart {  
    ...  
    public void pay( Consumer<Integer> method ) {  
        int total = cartTotal();  
        method.accept( total );    Strategy  
    }  
    ...  
}
```

# Functions

## Interface Function<T,R>

### Type Parameters:

T - the type of the input to the function

R - the type of the result of the function

### All Known Subinterfaces:

UnaryOperator<T>

### Functional Interface:

This is a functional interface and can therefore be used as the assignment target for a lambda expression or method reference.

```
@FunctionalInterface  
public interface Function<T,R>
```

Represents a function that accepts one argument and produces a result.

This is a functional interface whose functional method is `apply(Object)`.

### Since:

1.8

### Method Summary

All Methods	Static Methods	Instance Methods	Abstract Methods	Default Methods
Modifier and Type	Method and Description			
default <V> Function<T,V>	<code>andThen(Function&lt;? super R,&gt; after)</code> Returns a composed function that first applies this function to its input, and then applies the after function to the result.			
R	<code>apply(T t)</code> Applies this function to the given argument.			
default <V> Function<V,R>	<code>compose(Function&lt;? super V,&gt; before)</code> Returns a composed function that first applies the before function to its input, and then applies this function to the result.			
static <T> Function<T,T>	<code>identity()</code> Returns a function that always returns its input argument.			

```

# Recursões

# Fibonacci

$$f(n) = \begin{cases} 0 & \text{if } n = 0 \\ 1 & \text{if } n = 1 \\ F(n - 1) + F(n - 2) & \text{if } n > 1 \end{cases}$$

```
public static Long fib( int n ) {  
    if ( n < 2 ) {  
        return new Long( n );  
    } else {  
        return fib( n - 1 ) + fib( n - 2 );  
    }  
}
```

# Memoization

# Pure Functions

In computer programming, a function may be described as a pure function if both these statements about the function hold:

- 1-) The function **always evaluates the same result value given the same argument value(s)**. The function result value cannot depend on any hidden information or state that may change as program execution proceeds or between different executions of the program, nor can it depend on any external input from I/O devices (usually—see below).
- 2-) **Evaluation of the result does not cause any semantically observable side effect** or output, such as mutation of mutable objects or output to I/O devices (usually—see below)

# Manual

```
Integer doubleValue(Integer x) {  
    return x * 2;  
}
```

```
Integer doubleValue(Integer x) {  
  
    if (cache.containsKey(x)) {  
        return cache.get(x);  
    } else {  
        Integer result = x * 2;  
        cache.put(x, result) ;  
        return result;  
    }  
}
```

```
private Map<Integer, Integer> cache = new ConcurrentHashMap<>();  
  
public Integer fib(int n) {  
    if (n == 0 || n == 1) return n;  
  
    Integer result = cache.get( n );  
  
    if (result == null) {  
        synchronized (cache) {  
            result = cache.get(n);  
  
            if (result == null) {  
                result = fib(n - 2) + fib(n - 1);  
                cache.put(n, result);  
            }  
        }  
    }  
  
    return result;  
}
```

Java + FP  
to the rescue

```
private static Map<Integer, Long> memo = new HashMap<>();

static {
    memo.put( 0, 0L ); //fibonacci(0)
    memo.put( 1, 1L ); //fibonacci(1)
}

public static long fibonacci( int x ) {
    return memo.
        computeIfAbsent(
            x, n -> fibonacci( n - 1 ) + fibonacci( n - 2 ) );
}
```

# Currying

$$f(x,y) = y/x$$

$$f(2,3) \\ f(x,y) = y/x$$

$$f(2, y) = y / 2$$

$$g(y) = f(2, y) = y/2$$

$$\begin{aligned}g(y) &= f(2, y) = y/2 \\g(3) &= f(2, 3) = 3/2\end{aligned}$$

$$\text{CtoF}(x) = x * 9/5 + 32$$

```
static double converter( double x, double f, double b ) {  
    return x * f + b;  
}  
  
public static void main( String[] args ) {  
  
    Double celsius = 15.0;  
    Double fahrenheit = converter( celsius, 9.0 / 5, 32 ); //59 F  
}
```

```
static double converter( double x, double f, double b ) {  
    return x * f + b;  
}
```

```
static DoubleUnaryOperator curriedConverter( double f, double b ) {  
    return x -> x * f + b;  
}
```

```
static DoubleUnaryOperator curriedConverter( double f, double b ) {  
    return x -> x * f + b;  
}
```

```
public static void main( String[] args ) {
```

```
    DoubleUnaryOperator convertCtoF = curriedConverter( 9.0 / 5, 32 );  
  
    convertCtoF.applyAsDouble( 35 ); //95 F  
    convertCtoF.applyAsDouble( 15 ); //59 F  
  
}
```

```
static DoubleUnaryOperator curriedConverter( double f, double b ) {
    return x -> x * f + b;
}

public static void main( String[] args ) {

    DoubleUnaryOperator convertCtoF = curriedConverter( 9.0 / 5, 32 );
    convertCtoF.applyAsDouble( 35 ); //95 F

    DoubleUnaryOperator convertKmToMi = curriedConverter( 0.6214, 0 );
    convertKmToMi.applyAsDouble( 804.672 ); //500milhas
}
```

```
DoubleUnaryOperator convertBRLtoUSD = curriedConverter( 0.27, 0 );  
double usd = convertBRLtoUSD.applyAsDouble( 100 ); //27 USD  
  
DoubleUnaryOperator convertUSDtoEUR = curriedConverter( 0.89, 0 );  
convertUSDtoEUR.applyAsDouble( usd ); //24.03 EUR  
  
convertBRLtoUSD.andThen( convertUSDtoEUR ).applyAsDouble( 100 );  
//24.03 EUR
```

E agora?

Programar funcional em Java é  
uma mudança de paradigma

Java é multi-paradigma

Imperativo, OO e Funcional

Escolha o melhor deles para o  
seu problema

Programação Funcional  
trouxe uma nova vida  
para o Java

**DIVIRTA-SE!**

# Obrigado!!!
